

Modern (next-gen) techniques vs. foundational (traditional) techniques

While it may have different names, antivirus solutions have been around for a while and are proven to be very effective against known threats. There are a variety of foundational techniques that traditional endpoint protection solutions have relied on. However, as the threat landscape has shifted, unknown threats, such as malware that has never been seen before, have become more and more common. Because of this, new technologies have come to the marketplace. Buyers should look for a combination of both modern approaches, often referred to as “next-gen” security, as well as proven foundational approaches. Some key capabilities include:

Foundational capabilities:

- › **Anti-malware/antivirus:** Signature-based detection of known malware. Malware engines should have the ability to inspect not just executables but also other code such as malicious JavaScript found on websites.
- › **Application lockdown:** Preventing malicious behaviors of applications, like a weaponized Office document that installs another application and runs it.
- › **Behavioral monitoring/Host Intrusion Prevention Systems (HIPS):** This foundational technology protects computers from unidentified viruses and suspicious behavior. It should include both pre-execution and runtime behavior analysis.
- › **Web protection:** URL lookup and blocking of known malicious websites. Blocked sites should include those that may run JavaScript to perform cryptomining, and sites that harvest user authentication credentials and other sensitive data.
- › **Web control:** Endpoint web filtering allows administrators to define which file types a user can download from the internet.
- › **Data loss prevention (DLP):** If an adversary is able to go unnoticed, DLP capabilities would be able to detect and prevent the last stage of some attacks, when the attacker is attempting to exfiltrate data. This is achieved by monitoring a variety of sensitive data types.

Modern capabilities:

- › **Machine learning:** There are multiple types of machine learning methods, including deep learning neural networks, random forest, bayesian, and clustering. Regardless of the methodology, machine learning malware detection engines should be built to detect both known and unknown malware without relying on signatures. The advantage of machine learning is that it can detect malware that has never been seen before, ideally increasing the overall malware detection rate. Organizations should evaluate the detection rate, the false positive rate, and the performance impact of machine learning-based solutions.
- › **Anti-exploit:** Anti-exploit technology is designed to deny attackers by preventing the tools and techniques they rely on in the attack chain. For example, exploits like EternalBlue and DoublePulsar were used to execute the NotPetya and WannaCry ransomware. Anti-exploit technology stops the relatively small collection of techniques used to spread malware and conduct attacks, warding off many zero-day attacks without having seen them previously.
- › **Ransomware-specific:** Some solutions contain techniques specifically designed to prevent the malicious encryption of data by ransomware. Often ransomware specific techniques will also remediate any impacted files. Ransomware solutions should not only stop file ransomware, but also disk ransomware used in destructive wiper attacks that tamper with the master boot record.

- › **Credential theft protection:** Technology designed to prevent the theft of authentication passwords and hash information from memory, registry, and off the hard disk.
- › **Process protection [privilege escalation]:** Protection built to determine when a process has a privileged authentication token inserted into it to elevate privileges as part of an active adversary attack. This should be effective regardless of what vulnerability, known or unknown, was used to steal the authentication token in the first place.
- › **Process protection [code cave]:** Prevents use of techniques such as code cave and AtomBombing often used by adversaries looking to take advantage of the presence of legitimate applications. Adversaries can abuse these calls to get another process to execute their code.
- › **Endpoint detection and response (EDR):** EDR solutions should be able to provide detailed information when hunting down evasive threats, keeping IT security operations hygiene in excellent health and analyzing detected incidents. It is important to match the size and skillset of your team with the complexity and ease of use of the tool being considered. For example, selecting a solution that provides detailed threat intelligence and guidance, making it quick and easy to respond to a threat.
- › **Incident response/Synchronized Security:** Endpoint tools should at a minimum provide insight into what has occurred to help avoid future incidents. Ideally, they would automatically respond to incidents, without a need for analyst intervention, to stop threats from spreading or causing more damage. It is important that incident response tools communicate with other endpoint security tools as well as network security tools.
- › **Managed Threat Response (MTR):** MTR delivers 24/7 threat hunting, detection and response delivered by a team of experts as a fully managed service. Analysts should be able to respond to potential threats, look for indicators of compromise and provide detailed analysis on events that took place, where, when, how and why.

The “power of the plus”: combining multiple techniques for comprehensive endpoint security

When evaluating endpoint solutions, organizations should not just look for one primary feature. Instead, look for a collection of impressive features that encompass both modern techniques, like machine learning, as well as foundational approaches that have been proven to still be effective, and endpoint detection and response (EDR) for investigation and incident response. Relying on one dominant feature, even if it is best-in-class, means that you are vulnerable to single point of failure. Conversely, a defense-in-depth approach, where there is a collection of multiple strong security layers, will stop a wider range of threats. This is what we often refer to as “the power of the plus” – a combination of foundational techniques, plus machine learning, plus anti-exploit, plus anti-ransomware, plus EDR, plus much more.

As part of an endpoint security evaluation, ask different vendors what techniques are included in their solution. How strong are each of their components? What threats are they built to stop? Do they rely only on one primary technique? What if it fails?

Sophos vs. the Competition

Comparing products with different features is hard enough, but comparing their performance in simulated attacks, where an attacker's actions are potentially infinite and unknown, is nearly impossible. For those who choose to test on their own, an introductory testing guide can be found [here](#). However, many organizations choose to rely on third party assessments to aid their buying decisions.

360 Degree Assessment & Certification

In the Q2, 2019 MRG Effitas endpoint test Sophos Intercept X blocked 100% of the attacks tested. This was achieved with the default settings of Intercept X Advanced, while the majority of other products deployed additional protections for the test.

In addition to Sophos Intercept X, Avira Antivirus Pro, Bitdefender Endpoint Security, CrowdStrike Falcon Protect, ESET Endpoint Security, F-Secure Computer Protection Premium, Kaspersky Small Office Security, Microsoft Windows

Defender, and Symantec Endpoint Protection received a Level 1 passing grade.

Test Employed	Sophos Result
In the Wild 360 / Full Spectrum Test	100% block rate
Financial malware	100% block rate
Ransomware	100% block rate
PUA / Adware Test	100% block rate
Exploit/Fileless Test	100% block rate
False Positive Test	0 false positives

Avast Business Antivirus, McAfee Endpoint Security, and Trend Micro Worry-Free Business Security all failed the test.

Read the full report [here](#).

MRG Effitas Malware Protection Test

MRG Effitas conducted a commissioned test comparing the ability of different endpoint protection products to detect malware and potentially unwanted applications (PUA). Six different vendors, including Sophos, were reviewed in the test. Sophos ranked #1 at detecting malware, as well as #1 at detecting potentially unwanted applications. Sophos also had an impressive false positive rate.

COMPARATIVE PROTECTION ASSESSMENT

Read the complete results [here](#).

MRG Effitas Exploit and Post-Exploit Protection Test

As a follow up to their malware protection test, MRG Effitas also release a report comparing different endpoint solutions stop specific exploitation techniques. Sophos Intercept X far outperforming the other solutions tested. In fact, Sophos was able to block more than twice the amount of exploit techniques relative to most of the other tools tested.

EXPLOIT PROTECTION TEST RESULTS

The full report is available [here](#).

SE Labs Endpoint Protection Report

SE Labs Endpoint Protection Report Sophos Intercept X Advanced achieved a 100% Total Accuracy Rating for both enterprise endpoint protection and small business endpoint protection in the SE Labs endpoint protection test report (Jan - Mar 2020). Intercept X Advanced has been given a AAA rating by SE Labs in every test they have conducted, dating back to April 2018.

TOTAL ACCURACY RATINGS			
Product	Total Accuracy Rating	Total Accuracy (%)	Award
Sophos Intercept X Advanced	1,136	100%	AAA
ESET Endpoint Security	1,136	100%	AAA
Kaspersky Small Office Security	1,136	100%	AAA
Symantec Endpoint Protection Cloud	1,117	98%	AAA
Trend Micro Worry-Free Security Services	1,114	98%	AAA
McAfee Endpoint Security	1,107	97%	AAA
Microsoft Windows Defender Enterprise	1,101	97%	AAA
Bitdefender GravityZone Endpoint Security	1,099.5	97%	AAA
Webroot SecureAnywhere Endpoint Protection	993	87%	A

Gartner Magic Quadrant for Endpoint Protection Platforms

Gartner's Magic Quadrant for Endpoint Protection Platforms is a research tool that rates vendors on completeness of vision and ability to execute. Sophos has been named a "Leader" in the Gartner Magic Quadrant for Endpoint Protection Platforms for the eleventh consecutive report. Gartner praised Sophos for our strong endpoint protection, real-world endpoint detection and response (EDR) usability, as well as our unifying platform, Sophos Central. Gartner praised Sophos for our proven record at stopping ransomware, the deep learning technology that blocks never-seen-before malware, and our anti-exploit technology. According to Gartner, the success of Sophos Intercept X "has propelled Sophos beyond its SMB roots and increased its brand awareness in enterprise organizations".

The Forrester Wave™: Endpoint Security Suites

Forrester Research, Inc. conducts extensive product evaluations to create their report, interviewing both endpoint vendors and their customers. They evaluate vendors based on the strength of both their product and their strategy. Sophos has, once again, been named as a Leader in the Forrester Wave for Endpoint Protection Suites.

ESG Labs Intercept X Review

The Enterprise Strategy Group Lab tested Sophos Intercept X and determined:

“Intercept X stopped 100% of the exploit techniques that were missed by the traditional antivirus application.”³

The full report is available [here](#).

AV Comparatives

Intercept X made its first public AV-Comparatives Business Security Test appearance and ranked #1 for malware detection. We earned a 99.7% detection rate with just one false alarm in the "real world" test, and 99.9% detection and zero false alarms in the "malware" test.

	Malware Protection Rate	False Alarms on common business software
Avast, Bitdefender, Panda, Sophos, SparkCognition	99.9%	0
Cisco, Symantec, Trend Micro	99.8%	0
K7, McAfee	99.7%	0
Seqrite	99.6%	0
FireEye, Microsoft	99.5%	0
CrowdStrike, Endgame, VIPRE	99.2%	0
Kaspersky Lab	99.0%	0
Fortinet	98.9%	0
ESET	99.5%	0

PC Magazine

Intercept X received an "Excellent" Rating and their "Editor's Choice" award.

PC Magazine declared that Intercept X is "an instant win for anyone looking to provide a defense against ransomware for any sized business." They went on to say that it "has a wide range of sophisticated features to guard against malware of all forms, and has earned the praise of several independent labs as well as earned our Editors' Choice designation in our ransomware protection for business review roundup".

Extending Your Security: Consider Complete Protection

An endpoint security solution is just one part of an overall security strategy. Today's organizations are wise to look beyond the endpoint toward protecting the entire environment.

Ideally, a single vendor provides solutions that work together to give you consistent protection and policy enforcement throughout your organization. Working with a single vendor can provide better security, reduce administration, and lower costs.

Some specific technologies to consider along with endpoint protection include full disk encryption, mobile device management, mobile security, secure email gateway, specialized server or virtual machine protection, and Synchronized Security between endpoint and network devices.

Extending Your Security: Endpoint Detection & Response

Sophos Intercept X Advanced is the first EDR solution designed for IT administrators and security analysts to solve IT operations and threat hunting use cases. It allows you to ask any question about what has happened in the past, and what is happening now on your endpoints. Hunt threats to detect active adversaries, or leverage for IT operations to maintain IT security hygiene. When an issue is found remotely respond with precision.

Ask detailed threat hunting and IT security operations questions such as:

- Are processes trying to make a network connection on non standard ports?
- Which devices have known vulnerabilities, unknown services or unauthorized browser extensions?
- Understand the scope and impact of security incidents
- Detect attacks that may have gone unnoticed
- Search for indicators of compromise across the network
- Prioritize events for further investigation
- Analyze files to determine if they are a threat or potentially unwanted
- Confidently report on your organization's security posture at any given moment

Sophos Intercept X highlights include:

- EDR combined with the strongest endpoint protection
- Advanced, pre-written SQL queries to get the details you need
- Deep Learning Malware Analysis to replicate the role of malware analysts
- On-demand curated threat intelligence from SophosLabs
- Machine learning detection and prioritization of suspicious events
- Guided investigations that make EDR approachable yet powerful
- Respond to incidents with a single click

24/7 Expert Coverage: Managed Threat Response

Sophos MTR (Managed Threat Response) supports your organization with an experienced team of threat hunters and response experts who take targeted actions on your behalf to neutralize even the most sophisticated threats. Benefits include:

- 24/7 lead-driven threat hunting
- Security health checks
- Activity reporting
- Direct call-in support and a dedicated response lead
- Advanced protection against the latest threats with Intercept X

Evaluating Endpoint Security: Top 10 Questions to Ask

To evaluate an endpoint protection solution, start by asking the vendor the following questions:

1. Does the product rely on foundational techniques, modern techniques, or a combination of both? Which specific features are core to the technology?
2. How does the product detect unknown threats? Does it utilize machine learning?
3. For products claiming to leverage machine learning, what type of machine learning is used? Where does the training data come from? How long has the model been in production?
4. What technology exists to prevent exploit-based and file-less attacks? What anti-exploit techniques are leveraged, and what types of attacks can they detect?
5. Does the product have technology specifically designed to stop ransomware?
6. Does the vendor have third party results validating their approach?
7. Can the product ask detailed threat hunting and IT security operations questions? How long is the data retention period for searches?
8. What visibility into an attack does the vendor provide, such as root cause analysis?
9. Does the product automatically respond to a threat? Can it automatically clean up a threat and respond to an incident?
10. Does the product have the capability to let you remotely access devices to perform further investigation and take any necessary actions?

Conclusion

As cyber threats continue to grow in both complexity and number it's more important than ever to have effective protection in place at the endpoint. Understanding the threats you need to block and the different security technologies available will enable you to make an informed choice of endpoint security, and give your organization the best protection against today's attacks.
